Configuration Set Instance (POST)

Set a product configuration instance. This API is used in scenarios where the configuration instance is available in a different database than Salesforce and the product catalog management data is in Salesforce.

Resource

```
1 /connect/cpq/configurator/actions/set-instance
```

Resource example

```
1 https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configura
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
1 {
2   "configuratorOptions": {
3     "addDefaultConfiguration": true,
4     "executeConfigurationRules": true,
5     "executePricing": false,
6     "qualifyAllProductsInTransaction": false,
7     "validateAmendRenewCancel": false,
8     "validateProductCatalog": false
9   },
10  "contextMappingId": "11jEk000017YdyUIAS",
11  "qualificationContext": {
12    "accountId": "001DU000001nHUGYA2"
13  },
14  "transaction": "{\"Quote\": [{\"QuoteLineItem\": {\"businessObjectType\": \"
15  } }
```

Properties

configurator Options	Configurator Options Input	List of the configurator options to execute.	Optional	60.0
context MappingId	String	ID of the context mapping record.	Required	60.0
qualification Context	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
transaction	String	Transaction JSON payload representing an object in an external system that's used to create a session.	Required	60.0

Response body for POST
